

# Complete Git and Github

Download the latest version of Git and choose the 64/32 bit version. After the file is downloaded, install it in the system. Once installed, select Launch the Git Bash, then click on finish.

git: [Git - Downloads \(git-scm.com\)](https://git-scm.com/downloads)

## Git bash important command

1. `"ls"` command for see the file inside a folder
2. `"mkdir"` command for creating a folder
3. `"cd folder name"` for go into to folder
4. `"touch names.txt"` create file in folder
5. `cd /c/Users/john/Desktop/newproject` you can navigate to a folder that is inside multiple subfolders using the `cd` command
6. for going back from one folder `"cd .."`
7. for going root `"cd /"`
8. initialize git in folder `"git init"`
9. to delete any file `"rm -rf filename"`
10. `"git status"` is a command which is used to see the tracked or Untracked files or other changes  
Tracked file which is ready to push on github
11. `"git add file1.txt file2.txt"` to make this file as tracked file `"git add ."` to make all file in a folder
12. To add a folder file which is inside the main folder where .git file is ; we first go inside the folder then `git add filename"`
13. To commit `git commit -m "msg"`
14. To see all commit history `"git log"`

15. To delete commit history:

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git log
commit 73cfeaf34b1f4c879d2f5a907f3587edf62deab5 (HEAD -> master)
Author: Rakib-Hasan25 <you@example.com>
Date: Sun Jan 14 14:00:43 2024 +0600

    2nd commit

commit d0caef1f5b79dc3757e28460a80987c0fea59ac8
Author: Rakib-Hasan25 <you@example.com>
Date: Sun Jan 14 13:56:32 2024 +0600

    1st commit
```

We want to delete 2<sup>nd</sup> commit , we have to copy the 1<sup>st</sup> commit commit id  
And “git reset selectedCommitId”

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git reset d0caef1f5b79dc3757e28460a80987c0fea59ac8
Unstaged changes after reset:
M   rakib.txt

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git log
commit d0caef1f5b79dc3757e28460a80987c0fea59ac8 (HEAD -> master)
Author: Rakib-Hasan25 <you@example.com>
Date: Sun Jan 14 13:56:32 2024 +0600

    1st commit

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
```

16. To attach my local git repository with external Remote Repository

“git remote add origin <https://github.com/Rakib-Hasan25/GithubPractice.git>”

Remote means I am going to add url

Add means add

“Origin” is tell when we want attach my personal github account url

18.”git remote -v” tells us what are the url attach to our local git repository

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git remote add origin https://github.com/Rakib-Hasan25/GithubPractice.git

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git remote -v
origin https://github.com/Rakib-Hasan25/GithubPractice.git (fetch)
origin https://github.com/Rakib-Hasan25/GithubPractice.git (push)

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$
```

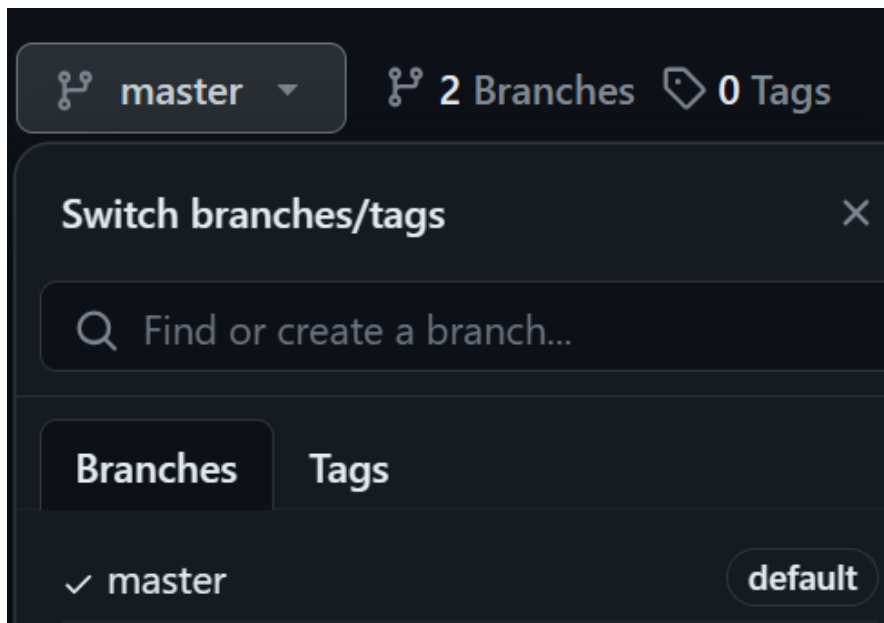

17. The url which we attach now , we want to push our data  
From a branch named master

“git push origin master” → means -> we want to push in the -> origin url (my github repository link) from the master branch

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git log
commit d0caef1f5b79dc3757e28460a80987c0fea59ac8 (HEAD -> master, origin/master)
Author: Rakib-Hasan25 <you@example.com>
Date: Sun Jan 14 13:56:32 2024 +0600

1st commit
```

This saying that our first commit is now push on the github/remote origin from master branch  
And head is now pointing to master branch -> that's means it we again push anything that will  
push from the master branch

18. Now we will change the branch :

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (master)
$ git checkout -b feature-branch
Switched to a new branch 'feature-branch'
```

And now switched to new branch named 'feature-branch'

And make changes like create folder, modify file etc and add them and commit them

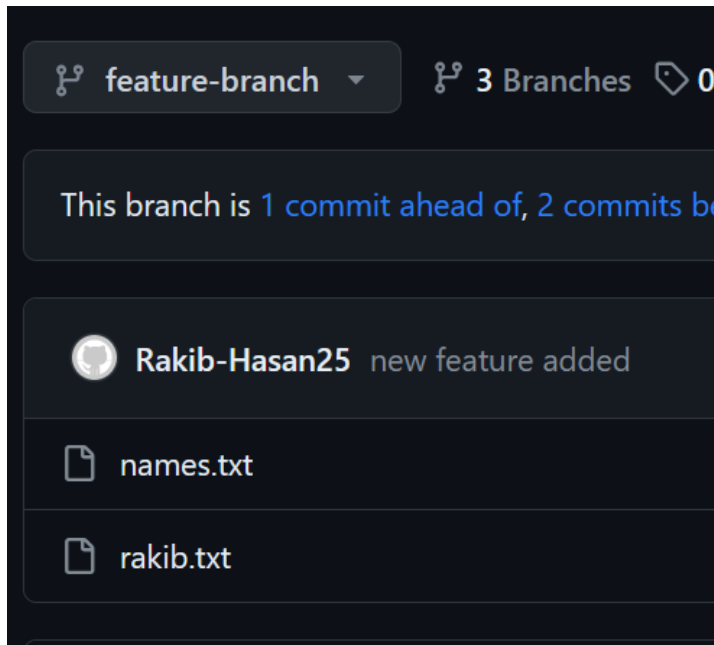

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject (feature-branch)
$ cd myname

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject/myname (feature-branch)
$ git add .

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject/myname (feature-branch)
$ git commit -m "some new features"
[feature-branch 1f6a8cc] some new features
1 file changed, 0 insertions(+), 0 deletions(-)
create mode 100644 myname/myname.txt
```

And now we will push this on my origin url (GitHub repository) from my featured branch

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/newproject/myname (feature-branch)
$ git push origin feature-branch

remote:
remote: Create a pull request for 'feature-branch' on GitHub by visiting:
remote:   https://github.com/Rakib-Hasan25/GithubPractice/pull/new/feature-branch
remote:
To https://github.com/Rakib-Hasan25/GithubPractice.git
 * [new branch]      feature-branch -> feature-branch
```

After that visit the github the thing which we now push, will be visible on github on feature branch

- ⇒ Important thing to note , pushed files are on the feature branch but if we want to merge it with our (master branch) , we have to do a pull request  
In github we will see a msg like the below

Now we have to click on pull request, after clicking we will see something like below

# Open a pull request

Create a new pull request by comparing changes across two branches. If you need to, you can also [compare across forks](#). [Learn more about diff comparisons here](#).

base: master ▾

...

compare: feature-branch ▾

✓ **Able to merge.** These branches can be automatically merged.

## Add a title

new feature added

...

Here we can tell the master branch what feature or what changes we have made

Markdown is supported

Paste, drop, or click to add files

Create pull request

After making a pull request , our master branch or (owner of the repository) we get request

[Code](#) [Issues](#) [Pull requests](#) 1 [Actions](#) ...

[Edit](#) [Code](#) [Jump to bottom](#)

## new feature added #2

[Open](#)

Rakib-Hasan25 wants to merge 1 commit into `master` from `feature-branch`

[Conversation](#) 0 [Commits](#) 1 [Checks](#) 0 [Files changed](#) 1

**Rakib-Hasan25** commented 1 minute ago ...

Here we can tell the master branch what feature or what changes we have made

 new feature added 0a45560

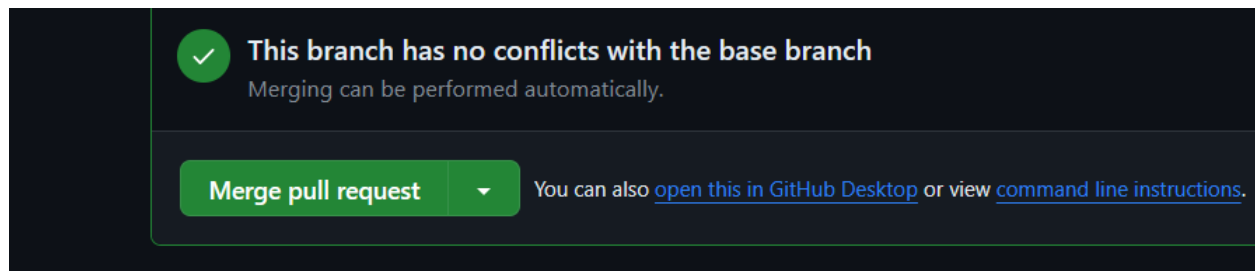

Add more commits by pushing to the `feature-branch` branch on [Rakib-Hasan25/GithubPractice](#).

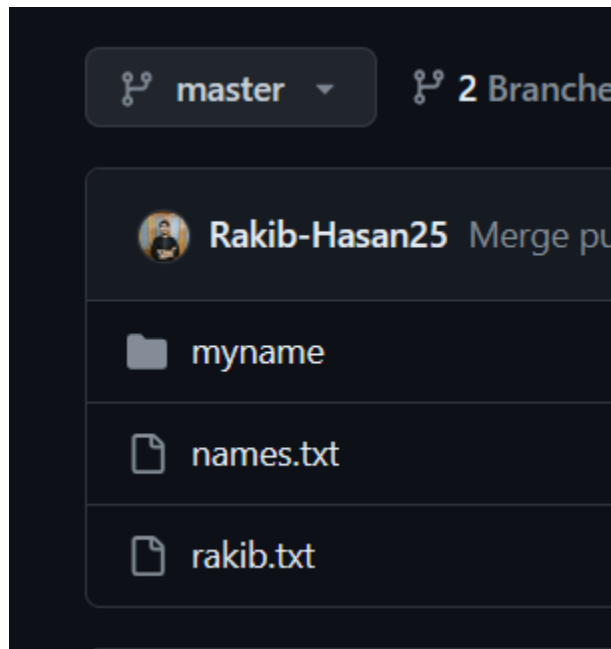

**Require approval from specific reviewers before merging**  
[Rulesets](#) ensure specific people approve pull requests before they're merged.

[Add rule](#) ×

If everything alright master branch /other owner will accept the pull request and our file will be added in master branch

Our feature-branch file now visible in master branch

## How to work on other public repository

1. We have to fork other repository in easy words we copy other project  
For example

It is an public project and we can Fork / copy this repository

By clicking on fork , we can see a page which can be look like below

## Create a new fork

A *fork* is a copy of a repository. Forking a repository allows you to freely experiment with changes without affecting the original project. [View existing forks.](#)

*Required fields are marked with an asterisk (\*).*

**Owner \***  Rakib-Hasan25 / **Repository name \*** Fashion-eCommerce-app

✔ Fashion-eCommerce-app is available.

By default, forks are named the same as their upstream repository. You can customize the name to distinguish it further.

**Description (optional)**

Flutter Fashion E-Commerce App! 🚀 👤 📦

☒ **Copy the `main` branch only**  
Contribute back to AmirBayat0/Fashion-eCommerce-app by adding your own branch. [Learn more.](#)

 You are creating a fork in your personal account.

[Create fork](#)

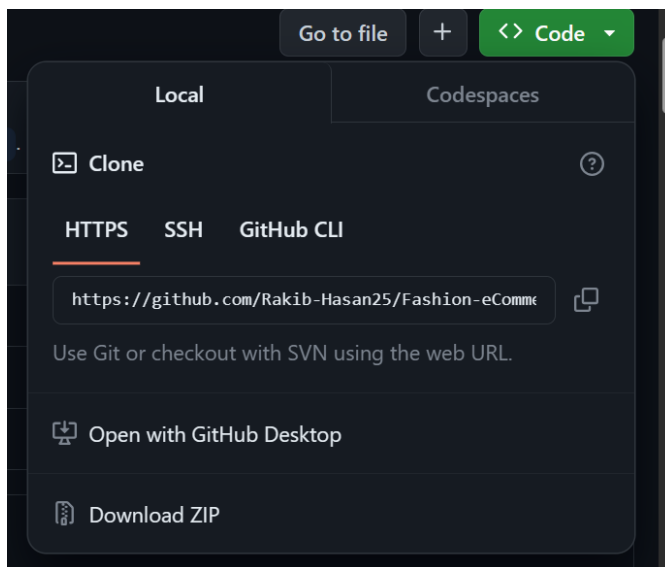

After clicking on create fork :

Clone the project in local:

In their I have to click on code

Copy this url

```
rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop
$ mkdir ProjectClone

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop
$ cd ProjectClone

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/ProjectClone
$ git clone https://github.com/Rakib-Hasan25/Fashion-eCommerce-app.git
Cloning into 'Fashion-eCommerce-app'...
fatal: unable to access 'https://github.com/Rakib-Hasan25/Fashion-eCommerce-app.git':
Could not resolve host: github.com

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/ProjectClone
$ git init
Initialized empty Git repository in C:/Users/rakib/Desktop/ProjectClone/.git/

rakib@rakibhasan MINGW64 /c/Users/Rakib/Desktop/ProjectClone (master)
$ git clone https://github.com/Rakib-Hasan25/Fashion-eCommerce-app.git
Cloning into 'Fashion-eCommerce-app'...

Resolving deltas: 100% (10/10), done.
```

We create a folder and initialized the folder with git  
And “git clone projecturl” it will clone this project

Important thing to note ; when we working on new features of a forked project and we have to make pull requests, for every pull request make a branch

If the forked project , main repository owner make some changes and I want to update my forked project with the Main repository changes

**We have to click on fetch upstream**

**Home Task: merge Conflict .**
